## ADM'S ANNUAL NCW AND C4I SPECIAL FEATURE

The ADF is committed to becoming fully networked across the land, air and maritime environments. The single service approach to intelligence gathering/ dissemination and situational awareness is long gone with many projects in this space taking a truly joint approach under the Joint Capability Group office. *ADM* aims to cover key programs and projects in this space including:

**COMMAND AND CONTROL** – Airborne Early Warning and ground-based command and control along with the evolution in PED technologies.

**COMMUNICATIONS** – The increasing role of tactical datalinks across the services will also be explored under the single service and joint model as will burgeoning space programs.

## SUSTAINMENT AND MRO

The readiness and sustainability of modern combat equipment and platforms is a key determinant of ADF warfighting capability. This edition of *ADM* will examine some of the major platform and equipment maintenance, sustainment and upgrade programs currently under way across all three services and how it plans to sustain and support current and future platforms plus wider fleet management issues across the organisation.
